

# Sending Comments to the Database with Statements

Comments in an SQL script, identified by the delimiters defined in Tool Properties dialog in the **SQL Commander/Comments** category under the General tab, are sent to the database by default. In some cases, you may not want to include the comments with the statement, for instance if your database does not handle them. You can then enable the stripping of comments using the **Strip Comments when Executing** toggle item in the **SQL Commander Options** menu button in the SQL Commander toolbar or in the **SQL Commander->SQL Commander Options** main menu.
